(57) Abstract :
This invention relates to a procedural system of sophistication focused on the traffic management in urban areas to give priority to emergency vehicles; hence, there will be a reduction in the time. taken by them to reach the.target places, and the public: will be safer. The integrated GPS navigation ·and 'traffic~ signal control convergence vehicles and traffic. management centers for real-time data communication ~between them. With ·a. !-kilometer radius from the crossroad, the vehicle activates'\Jlue lights; this visual signa] seeming to be the specific one which tells the drivers to leave the road to the emergency vehicles. The" blue lights" synchronize with the vehiCle's progress, ensuring a continuous cle3r path along the course of the road network. The system relies on a Google Maps API key to provide easy navigaiion and real-time route optimization based on traffic: conditions. It is indisputably that 4-minutes problem (delay) results in an escalations emergency mortality rate by 32%. For this reason, the system is critical for the fast, ·effective, and safe evacuation and reducing the emergency death toll. Subsequently, traffic is reduced, and thus the response time in an emergency situation is cut down, while also helping safe driving rules and regulations to be followed, which in turn can save lives.
