(57) Abstract :
communicatively coupled to a plurality of client payment systems, wherein the server is configured to: host a Shared Intelligence Network (SIN) database for storing aggregated, anonymized risk signals; and execute a machine learning model that uses data from said SIN to generate a fraud risk score for a transaction prior to its authorization. 5. The system as claimed in claim 4, wherein the machine teaming model is a gradient boosting algorithm that is trained on a feature set comprising a Social Disconnection Score derived from a real-time Social Graph Velocity Check as shown in [1Q2]. 6. The system as claimed in claim 4, wherein the server is further configured to transmit an API command selected from a group consisting of PASS, WARN, BLOCK, and CHALLENGE, based on the fraud risk score, as depicted in the client response.flow of [101]: 7. The system as claimed in claim -6, wherein-, the CHALLENGE command initiates a Social Confirmation Challenge on a client system, requiring a payer to provide out-of-band information about a payee to authorize the transaction. 8. The Shared Intelligence Network as claimed in claim 1, wherein the reputation profile for a payee comprises data fields including a first-seen timestamp, a transactional velocity calculated across all clients, and a count of fraud flags received from any client in the network.
